## SpeechCare can help them.

**LiPS** is an interactive program focusing on techniques for stimulating awareness of the oral-motor features of consonants and vowels. It integrates that oral-motor kinesthetic awareness with visual, auditory and language processing as a base for detecting phonemes within syllables, reading and spelling.

Your child will be engaged in problem solving and manipulative activities rather than memorizing responses by:

- Classifying and labeling consonants and vowels by their distinctive features,
- Using mouth pictures to track the identity, number, and sequence of sounds in simple and complex syllables and words, and
- Applying this phonemic awareness in spelling and reading.

Sessions are instructed by speech-language pathologist Debra L. Shaub.

Let us leave no child behind...

Research documents that phoneme-sequencing ability as the best single predictor of success in learning to read and spell. The LiPS Program successfully develops phonemic awareness and sequencing competence in reading and spelling.

Take advantage of

a program whose scope is more basic and more extensive than traditional phonics, spelling and reading instruction.
